The purpose of this document is to show snapshots of the prototype that was created. Our prototype consists of mobile screenshots of the banking app and screenshots of the simulated USSD menu.

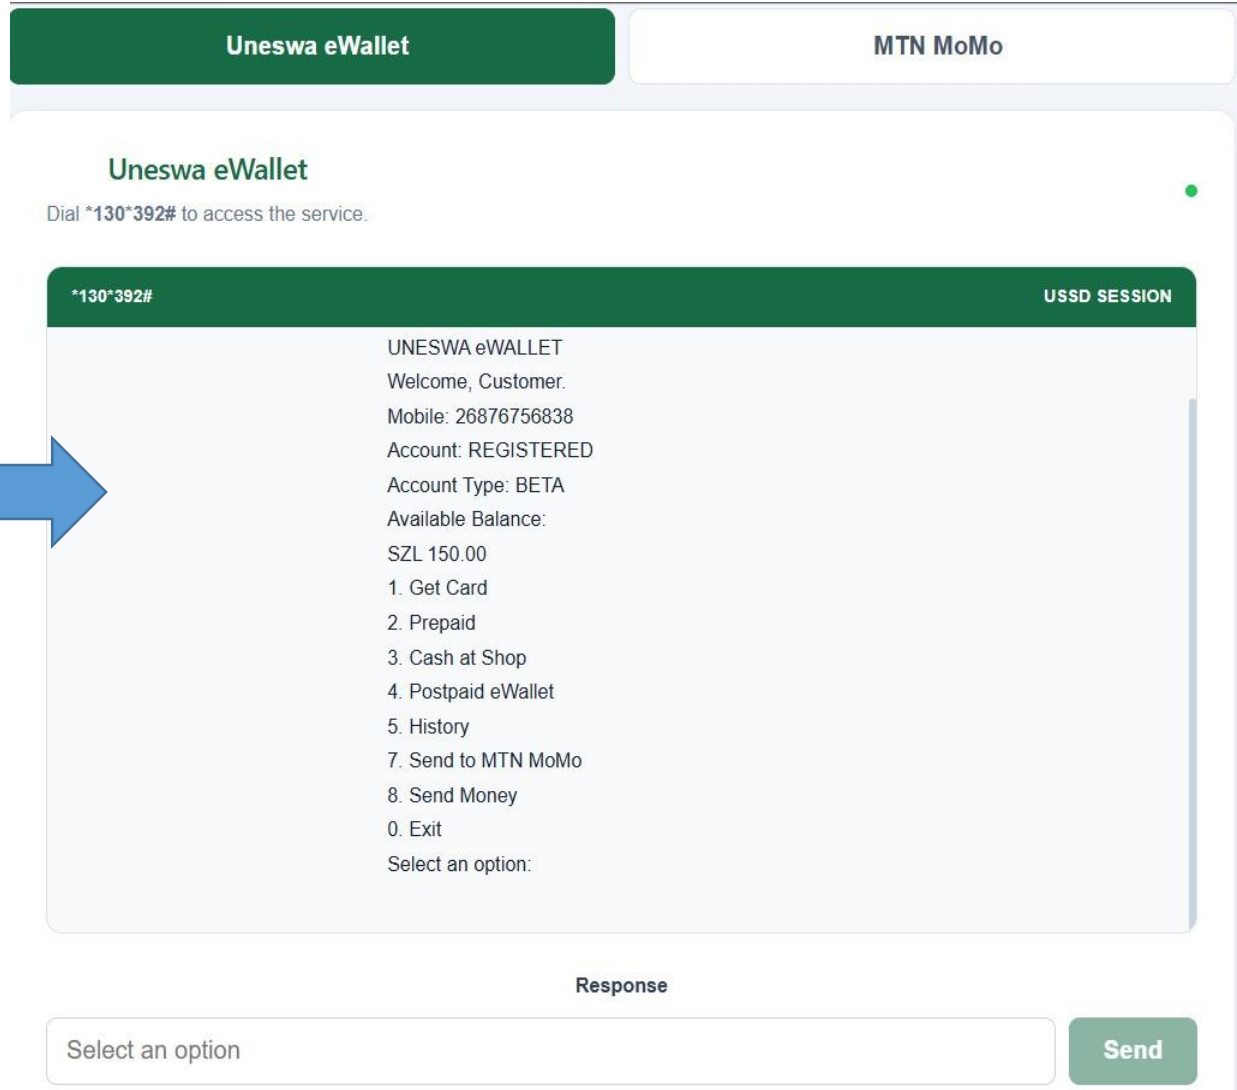

The next page shows screenshots of the banking app simulation of a user sending funds to an eWallet user.

Send

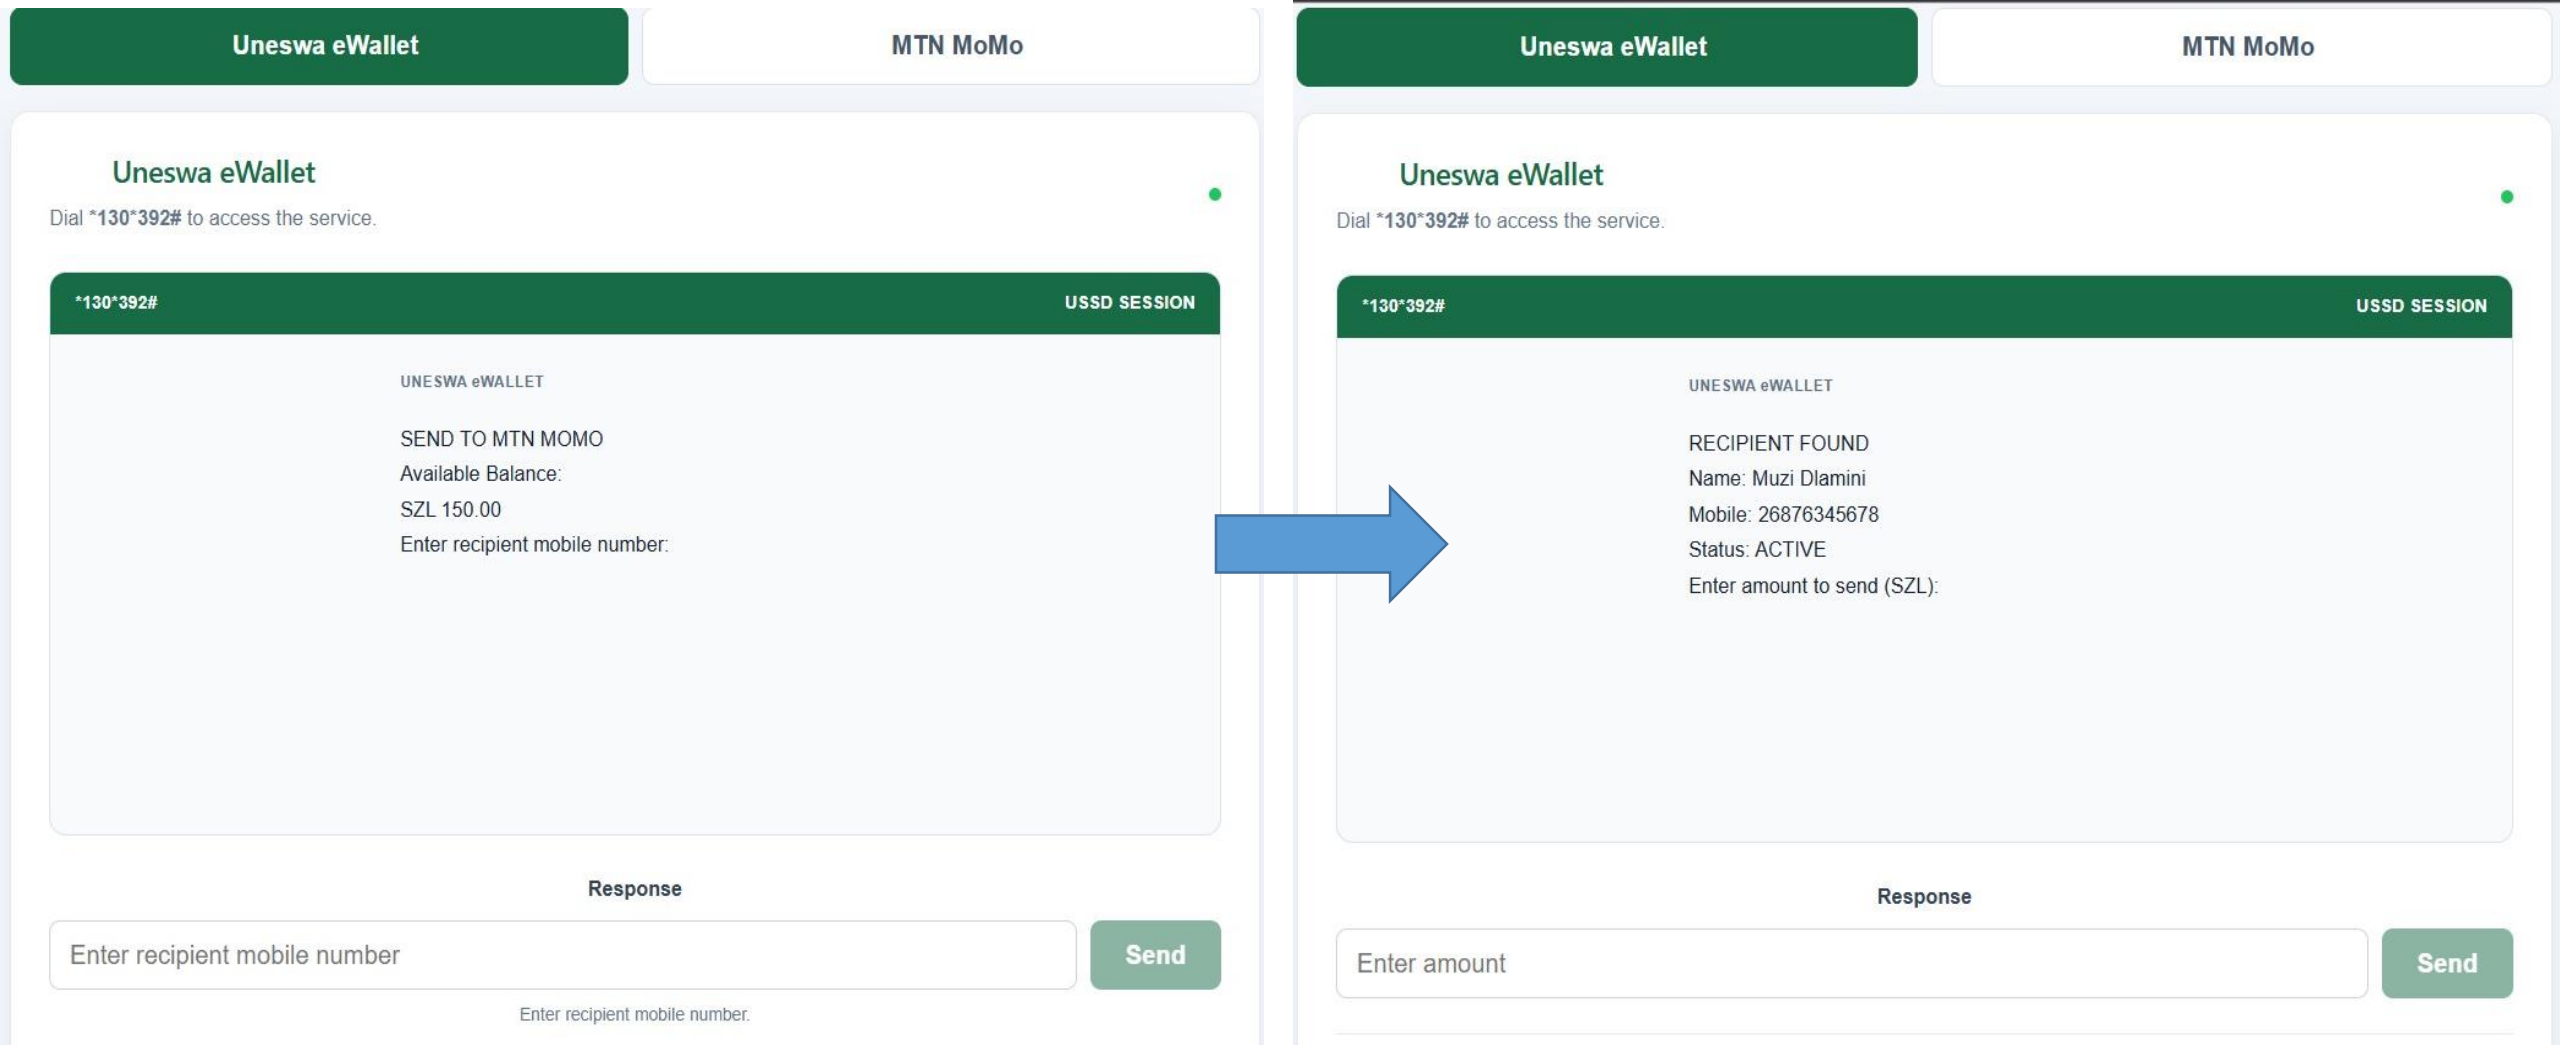

Once the user has initialized the payment from their bank account to an eWallet account, the eWallet user now has the option to either withdraw the money in the nearest CashPlus agent or ATM, or send it to a Mobile Money (MoMo) user. The latter is the focus of our project.

To represent two device interfaces for the USSD menu, a web application was used where two tabs represent each of the two devices. The tab with the green theme represents the eWallet interface and the other tab, themed yellow, represents the MoMo interface.

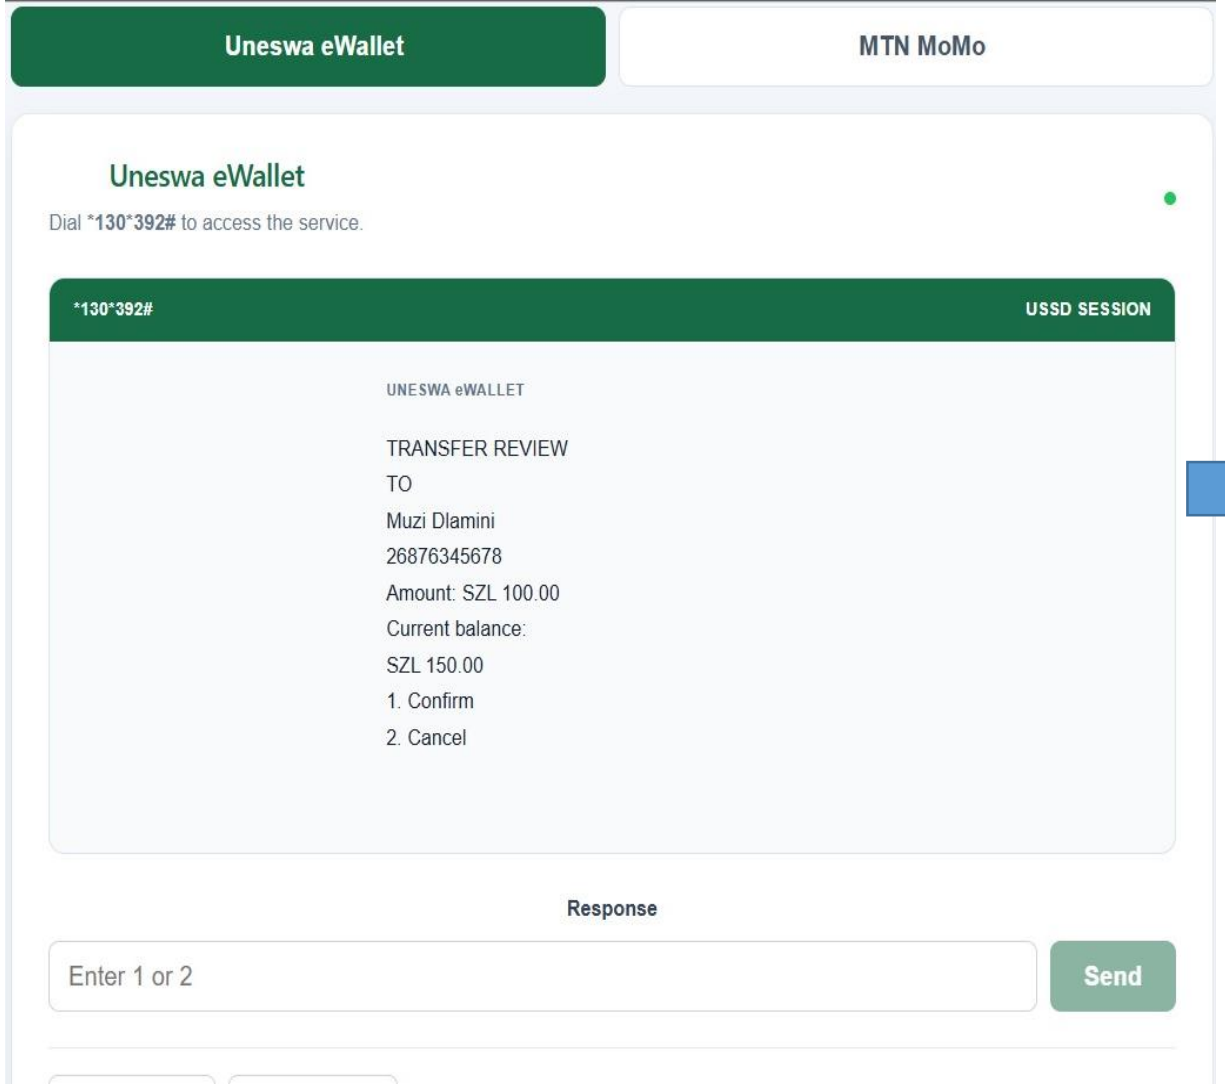

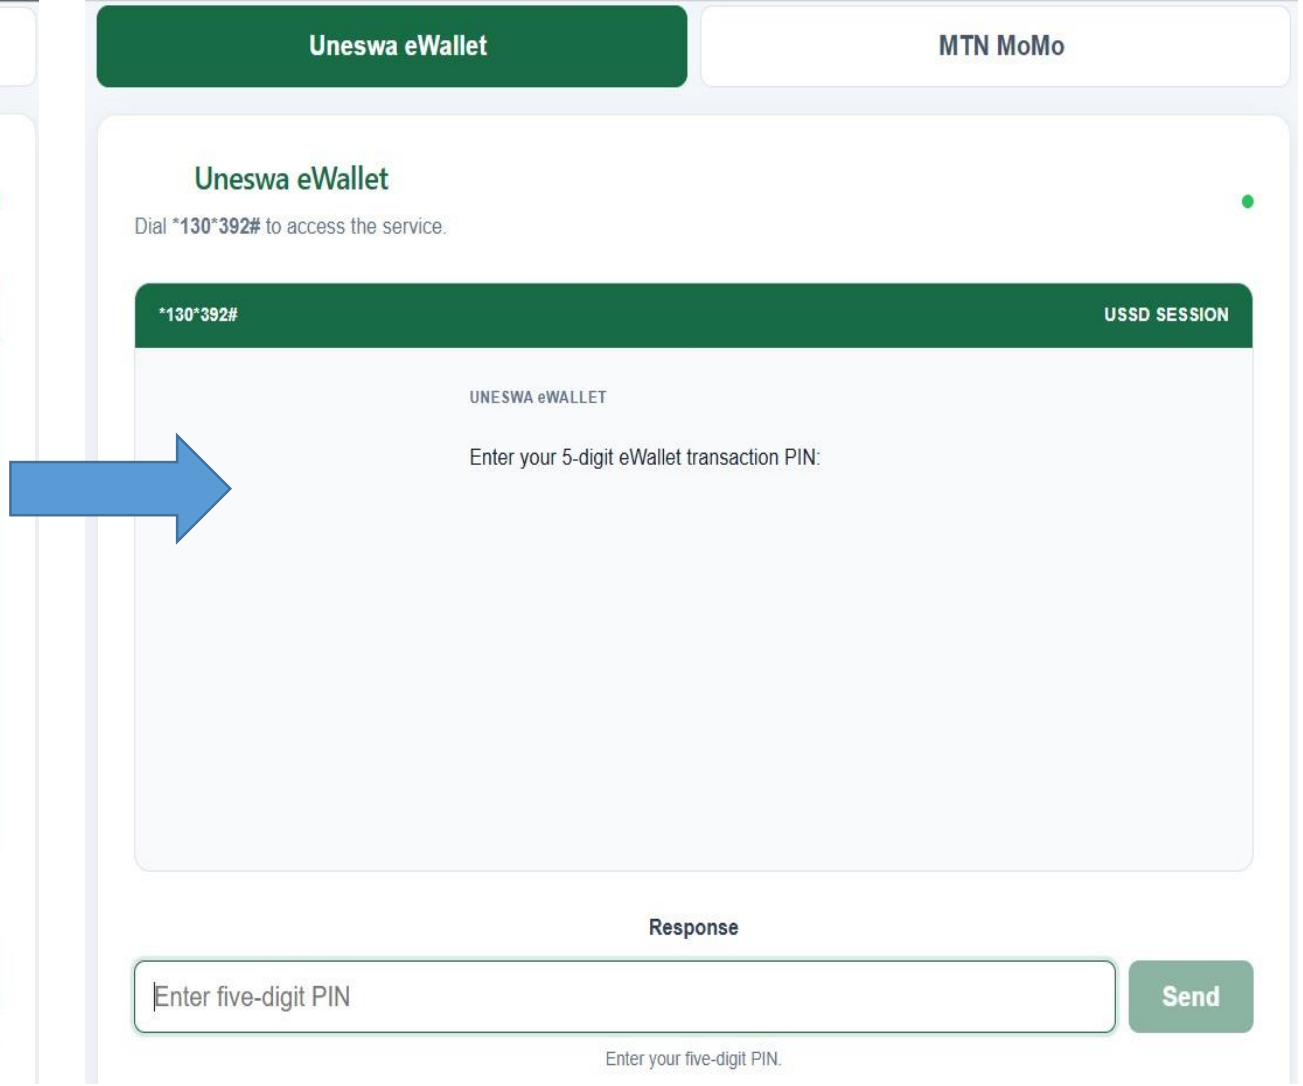

To get a specific device's instance, the mobile number that was sent the money is entered and the appropriate eWallet USSD menu appears. Only REGISTERED users have access to option 7.

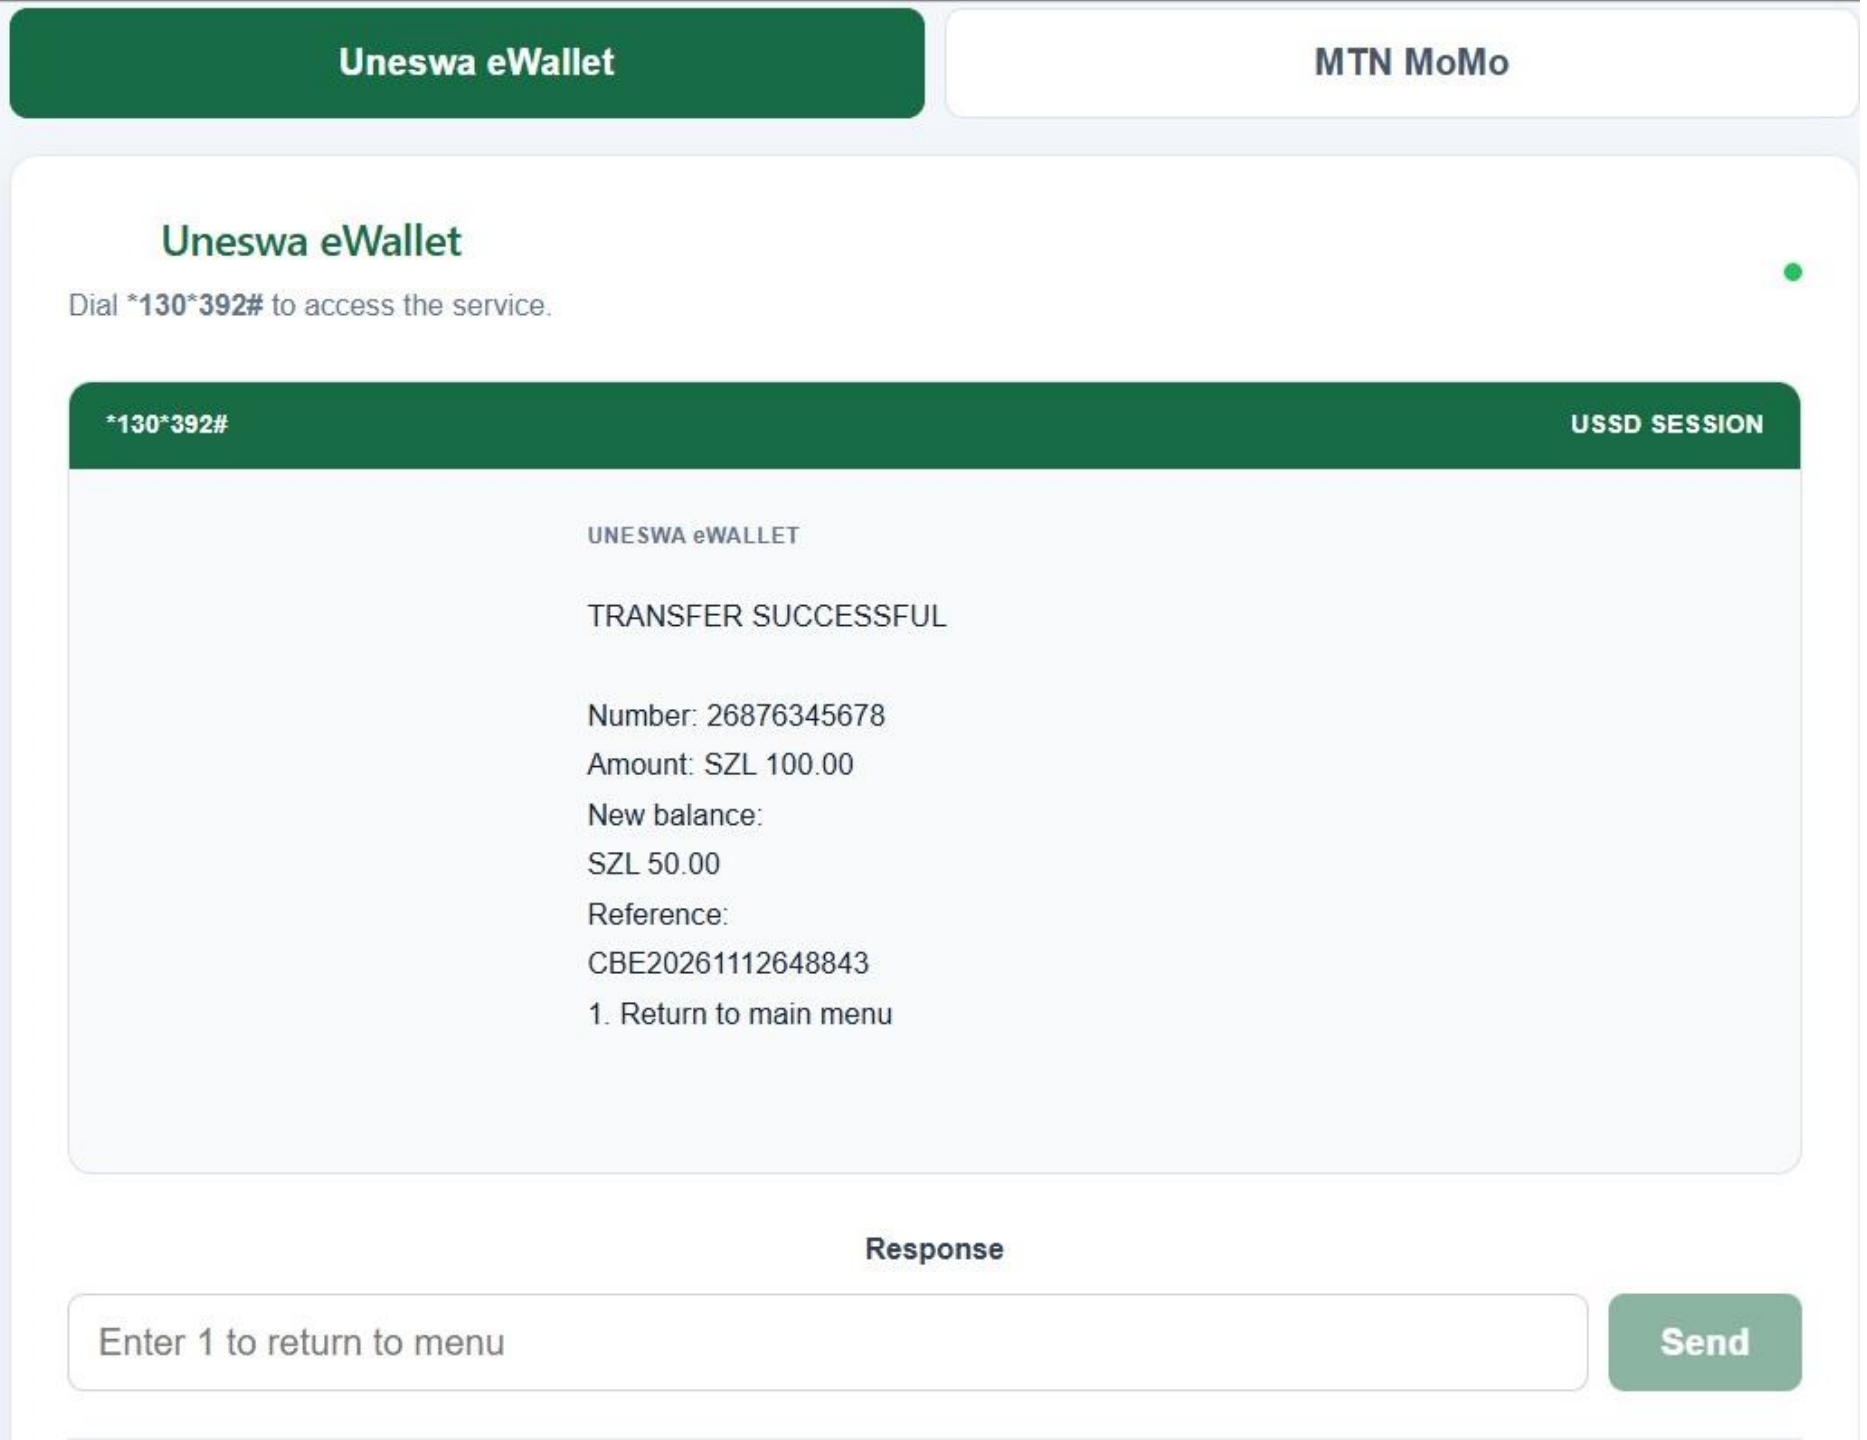

Once a REGISTERED user chooses option 7, they are prompted to enter the MoMo recipient's number and the amount they wish to transfer from their account.

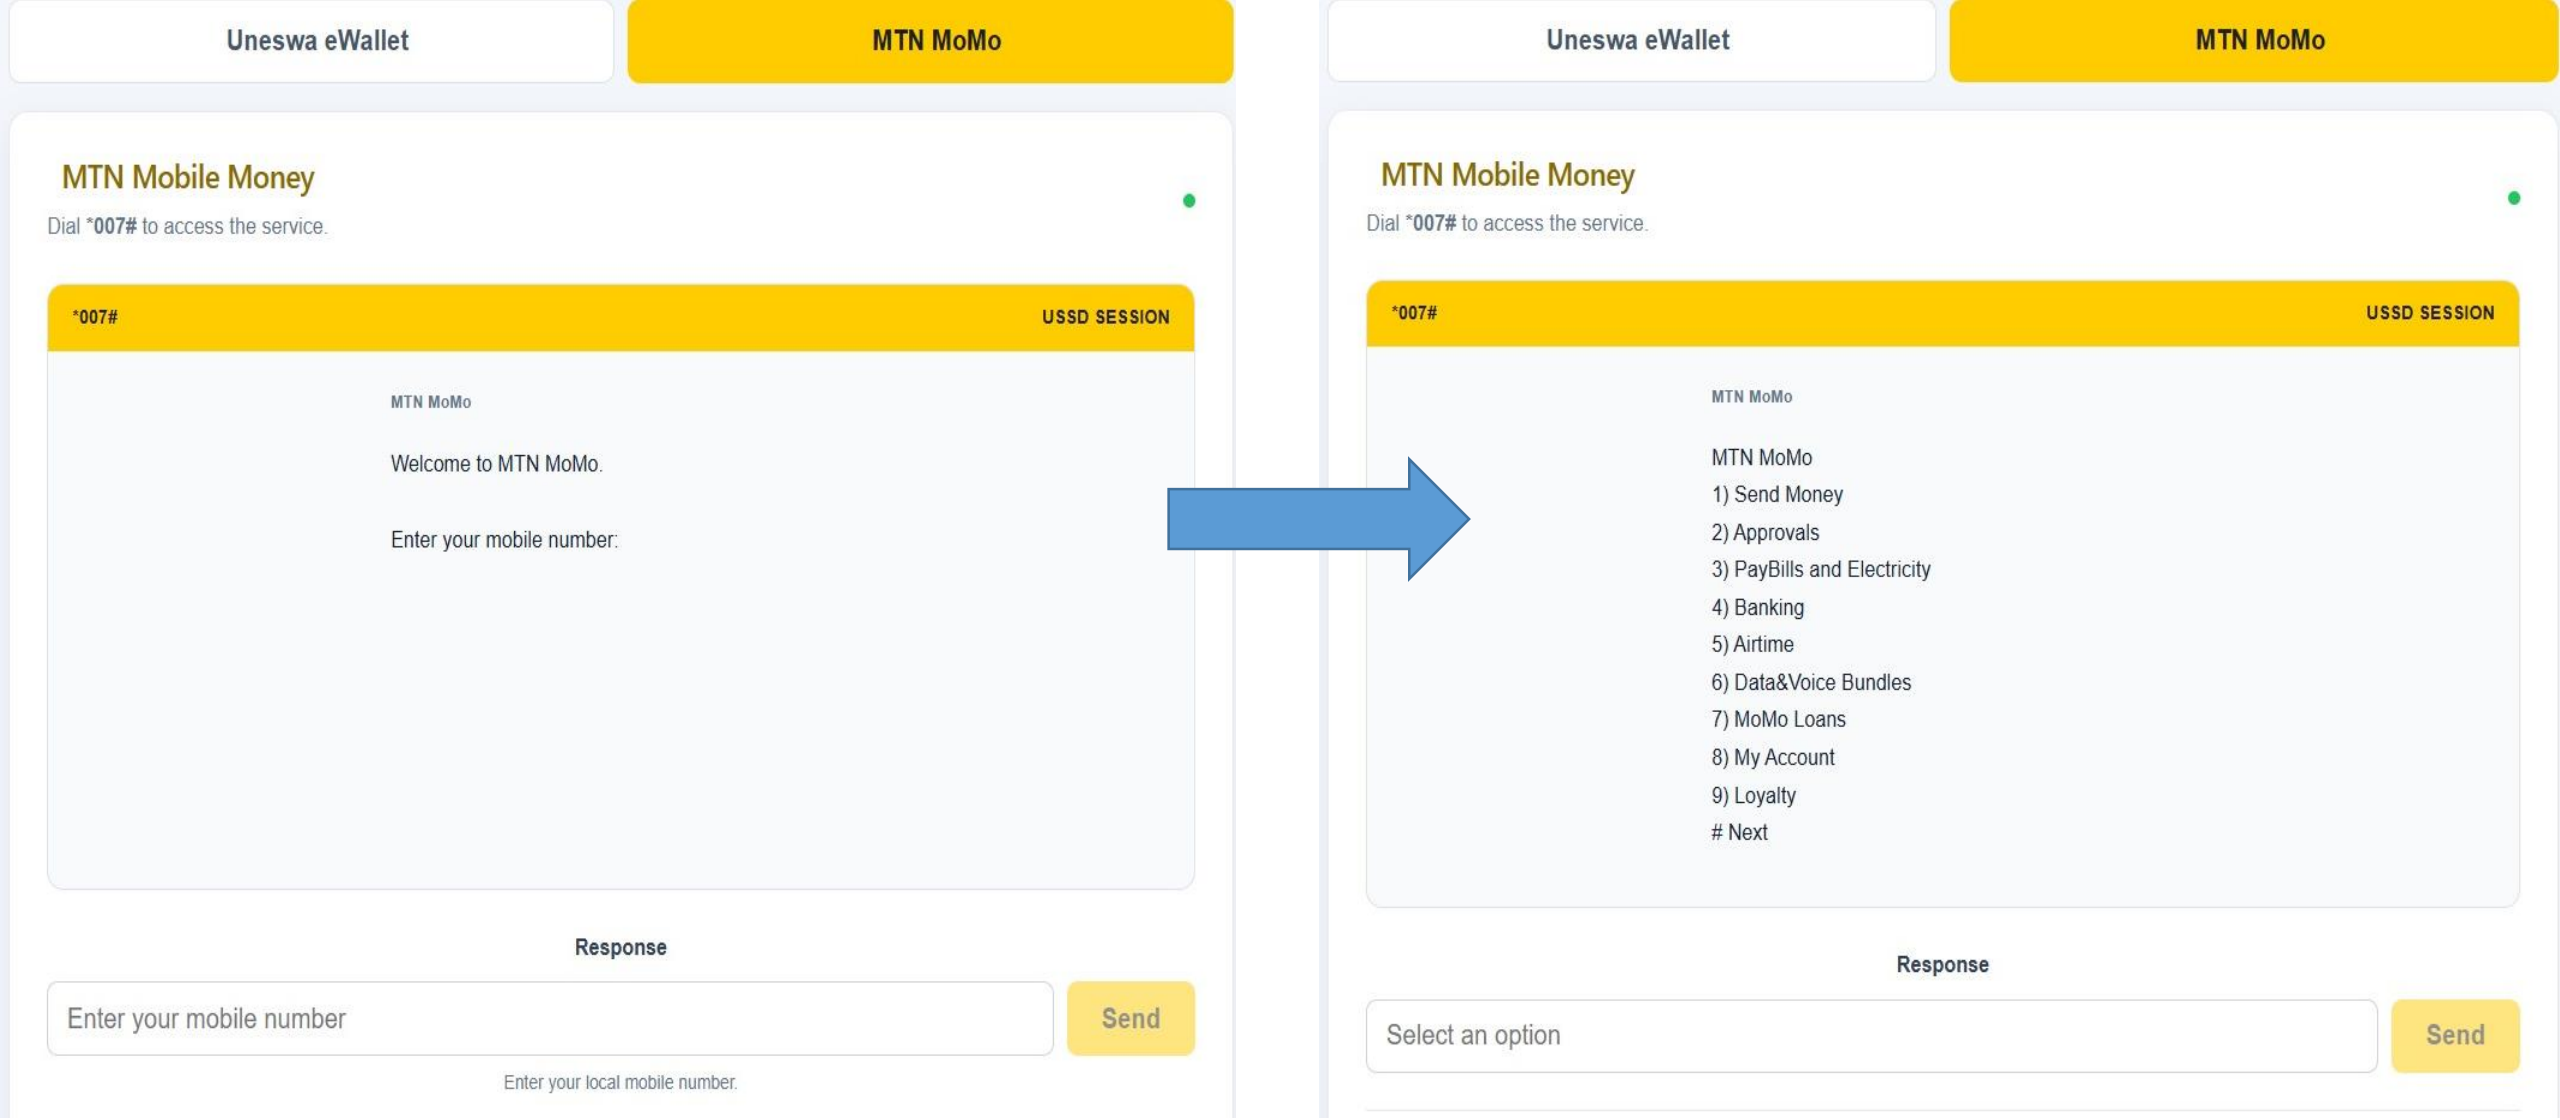

They are then prompted once more to confirm the recipient’s details and enter their PIN

At this point of the process, the status of the transaction is shown along with other details such as the amount transferred, the new balance and the reference for identification should issues arise.

To check if the recipient truly received the funds, we first enter their mobile number and select option 8 to check the balance.
